

Microsoft Internet Information Server 6.0, supported with EPM System 11.1.1.x, imposes deployment restrictions on 32-bit and 64-bit applications. Specifically, IIS 6.0 can either support 32-bit applications or it can support 64-bit applications, but a single IIS instance cannot simultaneously support 32-bit and 64-bit applications. This limitation has implications for EPM System 11.1.1.x.

FDM (32-bit) and Strategic Finance (32-bit) cannot be deployed on the same computer where Financial Management (64-bit) and Performance Management Architect (64-bit) are deployed. On 32-bit platforms, all EPM System products can co-exist.

Note: Financial Management and Performance Management Architect can co-exist on a 64-bit machine. And FDM (32-bit) and Strategic Finance (32-bit) can co-exist on a separate 64-bit or 32-bit machine.
